

# Post-Quantum Policy and Activities of the BSI

European Cyber Week 2024, Rennes, November 19, 2024

Dr. Kaveh Bashiri, BSI

# Agenda

- Motivation
- PQC@BSI
- Quantum-safe German Administration PKI
- BSI Study „Status of quantum computer development“

# Motivation

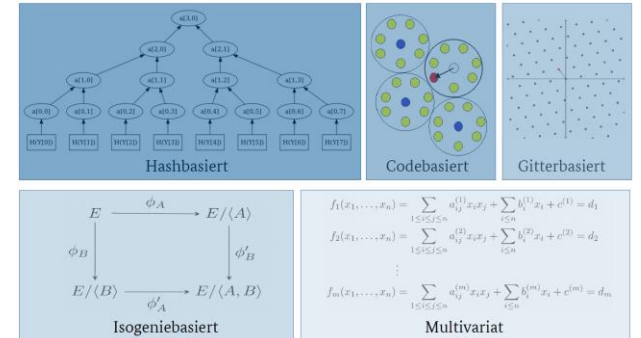

# Why Quantum-safe Cryptography?

Current Public Key  
Cryptography  
(RSA, (EC)DH, (EC)DSA)

## Post-Quantum Cryptography

# Two main threat scenarios

1

- *Store now, decrypt later*

Quantum-safe encryption

2

- *Complex migration (e.g. PKI)*

Mainly quantum-safe authentication

# Policies

MAY 04, 2022

## National Security Memorandum on Promoting United States Leadership in Quantum Computing While Mitigating Risks to Vulnerable Cryptographic Systems

BRIEFING ROOM | STATEMENTS AND RELEASES

Interesse wecken, Fachkräfte gewinnen	21
Auswirkungen im Blick behalten: Chancen erkennen und Auswirkungen betrachten	22

Zugeleitet mit Schreiben des Bundesministeriums für Bildung und Forschung vom 26. April 2023.

Quantenkommunikation und Post-Quanten-Kryptografie

In der Quantenkommunikation und der Post-Quanten-Kryptografie will die Bundesregierung bis 2026 folgende Meilensteine erreichen:

- Etablierung von ersten abhörsicheren, d.h. quantenverschlüsselten, Kommunikationsteststrecken zwischen ausgewählten Behördenstandorten.
- Weitere Start-ups/Firmen sind im Bereich der Quantenkommunikation in Deutschland gegründet.
- Realisierung eines bundesweiten Glasfaser-Backbones für die Quantenkommunikation und die Zeit- und Frequenzverteilung.
- Demonstration erster Quantenrepeaterstrecken.
- Start erster Testsatelliten zur Quantenschlüsselverteilung.
- Erstellung einer Strategie der Bundesregierung für die Migration zu Post-Quanten-Kryptografie in Deutschland.
- Weiterführung der Migration zu Post-Quanten-Kryptografie für den Hochsicherheitsbereich.

Drucksache 20/6610

- 26 -

Deutscher Bundestag – 20. Wahlperiode

- Einleiten der Migration zu Post-Quanten-Kryptografie in weiteren sicherheitskritischen Bereichen.
  - Integration von Post-Quanten-Kryptografie-Verfahren in praxistaugliche IT-Sicherheitslösungen.
- Für eine spätere Überführung in Produktsysteme sind im Anschluss weitere Schritte im Bereich der Prüfung, Zulassung und technischen Erteilung der beteiligten Komponenten und Infrastrukturen erforderlich.

## COMMISSION RECOMMENDATION

of 11.4.2024

on a Coordinated Implementation Roadmap for the transition to Post-Quantum  
Cryptography

“The Post-Quantum Cryptography Coordinated Implementation **Roadmap** should be available **after a period of two years** following the publication of this Recommendation, which will be followed by the development and further adaptation of Post-Quantum Cryptography transition plans of individual Member States, in accordance with the principles set out in the Post-Quantum Cryptography Coordinated Implementation Roadmap.”

# Policies

Brussels, 11.4.2024  
C(2024) 2393 final

- September 2024: Kickoff PQC-Workstream
- Co-chairs: France, Germany, Netherlands
- Goal: Develop roadmap for a harmonized transition towards PQC in the EU

## COMMISSION RECOMMENDATION

of 11.4.2024

**on a Coordinated Implementation Roadmap for the transition to Post-Quantum  
Cryptography**

# PQC @ BSI

# Working Hypothesis

For high security systems,  
BSI acts on the working hypothesis that **cryptographically  
relevant quantum computers will be available in the early  
2030s.**

**Remark:** This statement is not a forecast of the availability of quantum computers, but rather represents a **timeline for risk assessment.**

# BSI Guide „Quantum-safe cryptography“

In 2021 BSI published the guideline  
**Quantum-safe cryptography – fundamentals, current developments  
and recommendations:**

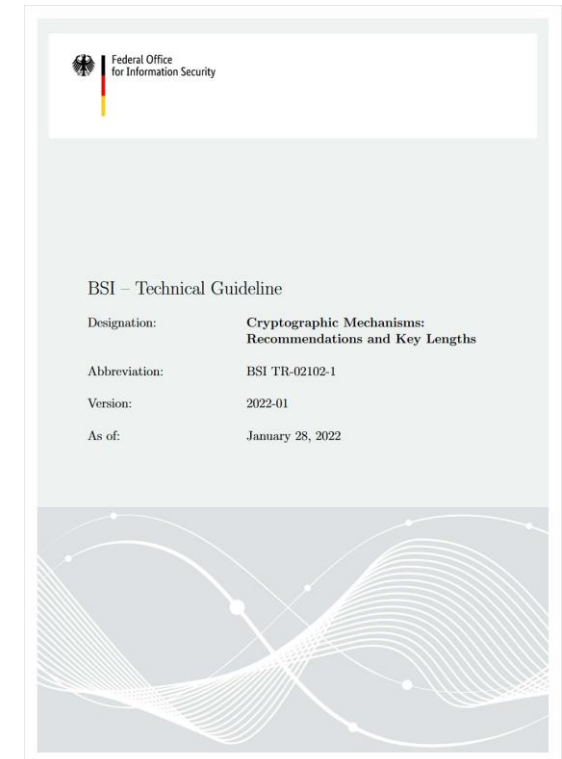

- Background on *quantum computers, PQC, protocols, QKD*
- Developments in politics, research and industry
- Recommendations for actions:
  - Preparation/inventory
  - Cryptographic agility
  - Conservative KEMs and signature schemes
  - Hybrid solutions in general

Reference: [www.bsi.bund.de/dok/pqmigration-en](http://www.bsi.bund.de/dok/pqmigration-en)

# BSI Technical Guidelines

- Key Encapsulation Mechanisms:
  - *FrodoKEM* and *Classic McEliece*
  - *ML-KEM* (for the 2025 update)
- Signature schemes:
  - *ML-DSA* (for the 2025 update)
  - *SLH-DSA* (for the 2025 update)
  - *LMS/HSS* and *XMSS/XMSS<sup>MT</sup>*
- Parameters: NIST security *categories 3* and *5*
- Only *hybrid solutions*, i.e. PQC+Classical KEMs and signatures  
One exception: hash-based signatures

# What about QKD?

## Some facts:

- Theoretical security based on physical principles
- Only key agreement
- Requires specialized (and expensive) hardware
- Distance limitations
- Implementation security must also be considered
- QKD protocols need to be standardized
- Associated security proofs need to be developed
- Certification criteria for QKD products need to be further developed
- Mature European QKD products need to be developed

**Migration to PQC has highest priority**

Bundesamt  
für Sicherheit in der  
Informationstechnik

## Position Paper on Quantum Key Distribution

French Cybersecurity Agency (ANSSI)  
Federal Office for Information Security (BSI)  
Netherlands National Communications Security Agency (NLNCSA)  
Swedish National Communications Security Authority, Swedish Armed Forces

### Executive summary

Quantum Key Distribution (QKD) seeks to leverage quantum effects in order for two remote parties to agree on a secret key via an insecure quantum channel. This technology has received significant attention, sometimes claiming unprecedented levels of security against attacks by both classical and quantum computers.

Due to current and inherent limitations, QKD can however currently only be used in practice in some niche use cases. For the vast majority of use cases where classical key agreement schemes are currently used it is not possible to use QKD in practice. Furthermore, QKD is not yet sufficiently mature from a security perspective. In light of the urgent need to stop relying only on quantum-vulnerable public-key cryptography for key establishment, the clear priorities should therefore be the migration to post-quantum cryptography and/or the adoption of symmetric keying.

This paper is aimed at a general audience. Technical details have therefore been left out to the extent possible. Technical terms that require a definition are printed in italics and are explained in a glossary at the end of the document.

# Backup management according to NIST SP 800-208, § 7

(Distributed multi-tree hash-based signatures)

- Create **top-level** Merkle-tree on HSM 0
- Create **bottom-level** Merkle-trees on HSM 1, HSM 2
- **Sign roots** of the bottom-level Merkle-trees with HSM 0
- Store **copies of the corresponding signatures and auth. paths** outside of the cryptographic modules
- **Sign messages** with HSM 1 (and then with HSM 2)
- **Initiate new HSM 3** as long as HSM 0 is operational

# Backup management according to NIST SP 800-208, § 7

(Distributed multi-tree hash-based signatures)

## Problem:

- Cryptographic modules may be operational for < 10y
- All HSMs might break at the same time
- Root-CA needs to be able to generate signatures for 10y

# Backup management

Private key backup necessary

## Problem:

- According to NIST SP 800-208 this is prohibited

## Solutions:

- NIST will update NIST SP 800-208
- <https://www.ietf.org/archive/id/draft-wiggers-hbs-state-00.html>

§6: Only allow export of seeds of unused subtrees

## Hash-based Signatures: State and Backup Management

### Abstract

Stateful Hash-Based Signature Schemes (S-HBS) such as LMS, HSS, XMSS and XMSS<sup>MT</sup> combine Merkle trees with One-Time Signatures (OTS) to provide signatures that are resistant against attacks using large-scale quantum computers. Unlike conventional stateless digital signature schemes, S-HBS have a state to keep track of which OTS keys have been used, as double-signing with the same OTS key allows forgeries.

This document provides guidance and documents security considerations for the operational and technical aspects of deploying systems that rely on S-HBS. Management of the state of the S-HBS, including any handling of redundant key material, is a sensitive topic, and we discuss some approaches to handle the associated challenges. We also describe the challenges that need to be resolved before certain approaches should be considered.

# Quantum-safe V-PKI – Choice of signature scheme

Candidates:

Algorithm	Pros	Cons
XMSS, LMS	<ul style="list-style-type: none"><li>• Well-understood security properties</li><li>• Performance (especially: signature- and PK-size)</li></ul>	<ul style="list-style-type: none"><li>• Statefulness (!)</li><li>• Backup management</li></ul>

# Some Insights from the Newest Update

- **Regev's Factoring Algorithm:**
  - Alternative to Shor's algorithm
  - Asymptotic improvement
  - Detailed analysis needed on efficiency gains for concrete cryptographically relevant factorization instances
  - Extended to DLP by Ekerå and Gärtner (but not for ECC)

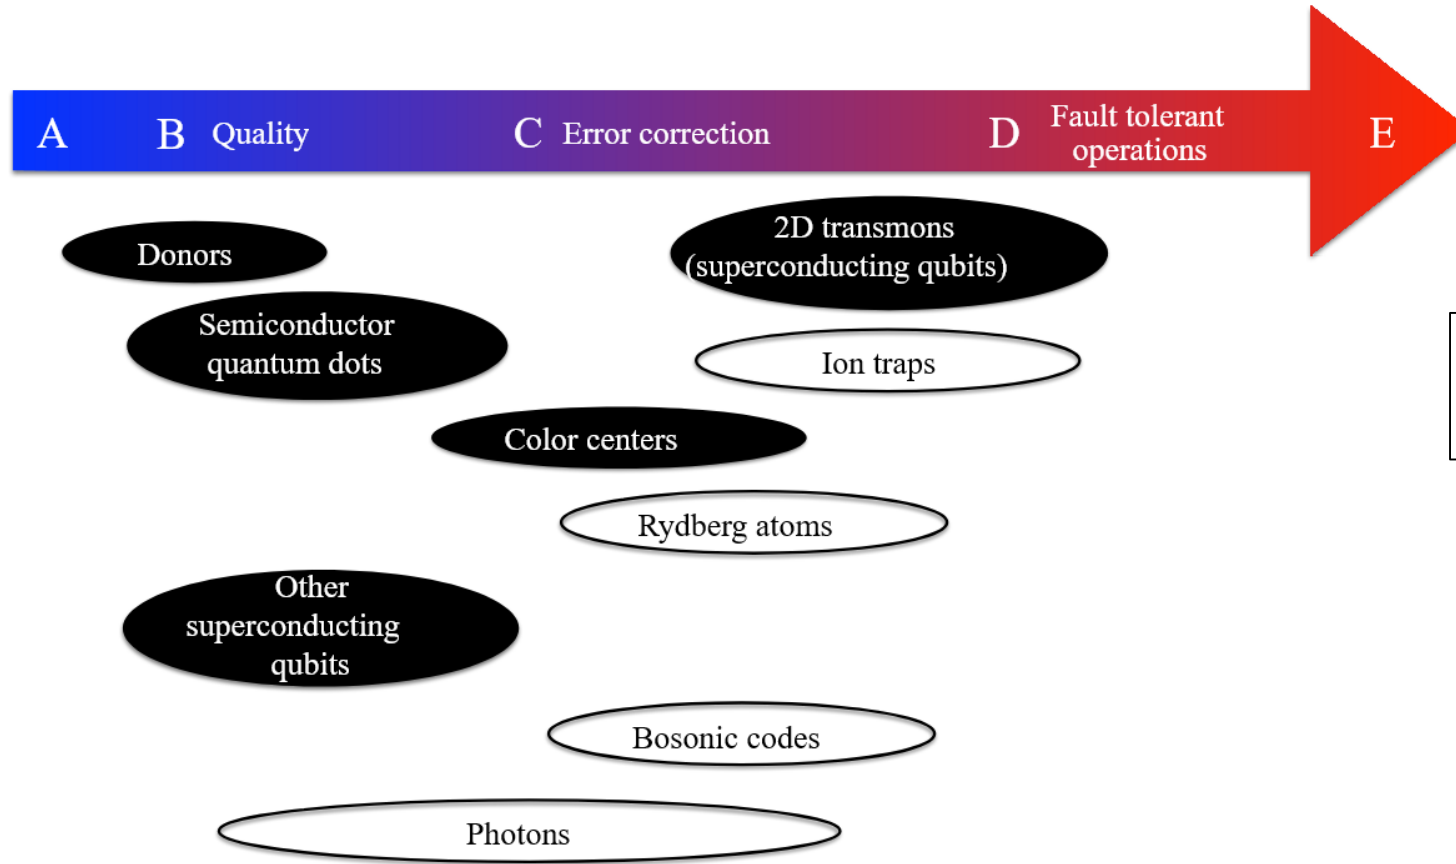

## An Efficient Quantum Factoring Algorithm

Oded Regev\*

### Abstract

We show that  $n$ -bit integers can be factorized by independently running a quantum circuit with  $\tilde{O}(n^{3/2})$  gates for  $\sqrt{n} + 4$  times, and then using polynomial-time classical post-processing. The correctness of the algorithm relies on a number-theoretic heuristic assumption reminiscent of those used in subexponential classical factorization algorithms. It is currently not clear if the algorithm can lead to improved physical implementations in practice.

# Some Insights from the Newest Update

## Logical quantum processor based on reconfigurable atom arrays

[Dolev Bluvstein](https://orcid.org/0000-0002-9934-9530) <sup>1</sup>, [Simon J. Evered](https://orcid.org/0000-0001-8986-1103) <sup>1</sup>

- Neutral atoms using Rydberg states became a TOP candidate among ion traps and 2D transmons (superconducting qubits)

# Some Insights from the Newest Update

## Quantum error correction below the surface code threshold

Google Quantum AI and Collaborators  
(Dated: August 27, 2024)

- Quantum error correction beyond break-even point:
  - Error-corrected quantum memory with surface codes of increasing distance (up to distance 7)
  - Logical qubit error is under the physical qubit error threshold  
➔ Increasing code distance leads to better results
  - Achieved by a number of engineering improvements
  - A main insight is that the background of rare correlated “catastrophic” events has been significantly reduced

## Hardware-efficient quantum error correction using concatenated bosonic qubits

Harald Putterman,<sup>1,\*</sup> Kyungjoo Noh,<sup>1</sup> Connor T. Hann,<sup>1</sup> Gregory S. MacCabe,<sup>1</sup> Shahriar Aghacimeibodi,<sup>1</sup> Rishi N.

(Dated: October 10, 2024)

# Some Insights from the Newest Update

- **Conclusions:**
  - Steady progress towards cryptographic relevance
  - Estimated time horizon: Decision pending
  - However, huge step forward is expected as soon as heuristic claims become rigorous

# Summary

- Most of the **public-key cryptography** deployed today is **threatened by** large-scale **quantum computers**.
- „*Store now, decrypt later*“ is a real threat & considerable migration times are to be expected.  
➔ **PQC-migration has to be initiated NOW!**
- **Cryptographic agility** should become a **design criterion**.
- In general, PQC should be used in **hybrid mode** together with RSA or ECC.
- **QKD** is **not sufficiently mature** from a security perspective. Once it is, it could be **an addition to post-quantum cryptography** for a limited set of use cases.
